

DX0.4 and DX0.6 Control Software

Release notes for version 1.0.0 (March 2024)

- The Installation program now sets up the USB driver automatically.
- Future releases will now automatically overwrite previous releases and install into the directory **DX Series**. The current previous release is installed in the directory **DX Series v0.2.2** and you will need to uninstall this release by hand.
- The **Online/Offline** button at top right of the processor window now works. Previously you could only use the **Online/Offline** button at top right of the processor icon.
- If **System lock** for the GUI is switched on and you click the **Settings** icon when logged out, the app now accepts Admin or Expert passwords. Previously, it displayed the message `Wrong password` even when you typed the correct password.
- In **User settings** (Settings > User) we have corrected the name of the setting **Hide locked parameters** to **Display locked parameters** and **Hide all outputs** to **Display all outputs**.
- If you set up some **User settings** (Settings > User), put a processor online and select **Load current settings to device**, the app now displays a more helpful error message.
